SALES DATA VISUALIZATION — ANALYSIS REPORT

One-page summary | Black & white edition

Executive Summary

The Power BI dashboard summarizes sales records through KPI cards and charts for payment mode, sale type, quarterly profit records, products, categories, quantity, and sales amount. It is intended to help users compare transaction patterns and identify areas for further review.

Key Dashboard Figures

Metric	Displayed value	Meaning / check
Count of dates	374	Records counted for the date field in the visible dashboard.
First sales amount	100.5312	A first-value aggregation, not total sales; use only if this is intentional.
First profit	-0.088	A first-value aggregation; negative value may indicate a loss for that record.
Sum of quantity	4K	Approximate total quantity shown.
Count of sales amount	527	Number of nonblank sales-amount records counted.

Main Observations

Payment mode: Cash has 264 records (50.1%) and Online has 263 (49.9%), indicating an almost even split in the displayed data.

Sale type: Direct Sales is the largest segment (283; 53.7%), followed by Online (167; 31.7%) and Wholesaler (77; 14.6%).

Quarterly trend: The line chart's record count falls from about 139 in Q1 to 121 in Q4, with a rise in Q3. The visual counts profit records rather than summing profit, based on its current aggregation.

Products and categories: Product-level bars compare record counts. The category chart compares quantity with a count of profit records; the visible quantity pattern places Personalcare highest, then Household and Beverage, with Furniture lowest among the shown categories.

Recommendations

1. Replace default titles with clear labels such as “Sales by Payment Mode,” “Sales Channel Mix,” and “Quarterly Profit Records.” 2. Review “First Sales Amount” and “First Profit”: use Sum or Average only when appropriate for the intended KPI. 3. Check visuals using “Count of Profit” or “Count of Sales Amount”; they may show record counts rather than actual profit or revenue. 4. Add currency/units, a reporting period, and clear axis labels. 5. Validate figures against the source data before making decisions.

Limitations

The report summarizes the dashboard values visible in the provided screenshot and the field/aggregation names in the uploaded PBIX structure. Figures were not independently recalculated from row-level data, so conclusions are descriptive and should be validated in Power BI.
